

# Transgenics, bombardments, and chips

Steven Kuntz  
August 10, 2005

- Hox project status
- Ballistic Injections
- ChIP-chip algorithm and results

# C. elegans vs. C. briggsae vs. CB5161: lin-39 and ceh-13

- Window: 30 Threshold: 25

Lin-39 (- strand)

Ceh-13 (+ strand)

# Summary of Computationally Identified Elements in Common with *C. elegans*

# Enhancer L1 expression

**Expression in L2 posterior intestine**

**Expression in adult vulval muscles**

# Enhancer L2 expression

**Expression in L1  
ventral chord  
neurons**

**Expression in L1 posterior  
ventral chord neurons and Q  
cells**

# Enhancer H1 expression

**Expression  
in embryos**

**Expression in L1 in intestine and V cells?**

# Enhancer H4 expression

**Expression in  
L2 posterior**

**Expression in L2  
anterior in excretory  
and G cells?**

# Enhancer H5 expression

Posterior ← Anterior

**Expression in larval posterior bodywall muscle and anal depressor cell**

**Expression in adult posterior bodywall muscle**

Not pictured: Expression in posterior enteric muscle and posterior intestine

# Enhancer H7 expression

- Described by Streit, et al.

**Expression in  
adult mid-body  
in gonad?**

**Expression in adult  
anterior bodywall  
muscle**

**Ventral view of  
adult mid-body  
expression**

# Upstream Region W2

Embryonic  
expression

Adult mid-body expression in  
bodywall muscle, dermis, and  
intestine?

# Future directions

- Male expression
  - him-14 RNAi
- Intervening expression
  - elements cloned, awaiting injection
- Finish summation expression
  - elements cloned, awaiting injection

# Status of Ballistic Injections (Biolistics)

- Procedure
  - Growth conditions
  - Nematode purification
  - Gold bead preparation
  - DNA-coating
- Co-injection markers
- DNA
  - Preparation
  - Topology

# Cotransformation

- Myo-2::gfp and unc-54::gfp
  - 100% cotransformation in 41 F1's
- Myo-2::gfp and pPD107.94
- Myo-2::gfp and pha-1 rescue
- Unc-119 rescue and experimental constructs

# Time and efficiency for liquid culture-based ballistics

- 10-40 shots in 2 hours
  - 1-6 constructs per hour if in triplicate
  - Minimum size determination *in process*
  - Not including time to make solutions/set up bacteria
- ~1 stable line per shot
  - Published rate of 30% integration
- Several week turn-around time

# ChIP-chip feature determination analysis

# Feature Domains and Features

- Feature Domain of variable size
  - Minimum size set at 200 bp
- Features always at 50 bp
- Variations
  - Interexonic regions
    - Intergenic plus introns
    - Exons
    - Small introns
  - Indiscriminant placement
- Based on Li and Stormo. *Bioinformatics* 17(11):1067-1076, 2001.

# Control features

## Random sequence

Generated 1000 unique sequences not found in *C. elegans*

*De novo* generation of IDT oligos to clone these fragments

~\$30 per oligo

## Complex repeats

~682 independently defined complex repeats

*C. briggsae* and *C. remanei*

90 genes

10 kb upstream and downstream included

# Fatal errors

- Masked sequence
  - Threshold set at 10 bp
  - Set at 0 for *C. remanei* and *C. briggsae*
- Base content
  - Threshold for content set at 50% (25 bp)
- Strings of bases
  - Threshold set at 30% (15 bp)

# Self-hybridization

- Sliding window analysis
- Optimized for fewer than 15 bp self-hybridization

# T<sub>m</sub>

- Nearest-neighbor and initialization approach
- $\Delta H = \sum H_{\text{partial}} + \sum H_{\text{init}}$  and  $\Delta S = \sum S_{\text{partial}} + \sum S_{\text{init}}$
- Salt correction
- $T_m = \Delta H / (\Delta S + R \ln(c/4)) - 273.15 + 16.6 \log[K^+]$
- Based on
  - SantaLucia. *PNAS* 95:1460-1465 1998.
  - Allawi and SantaLucia. *Biochemistry* 36(34):10581-94, 1997.
  - Rychlik, Spencer, and Rhoads. *Nucleic Acids Research* 18(21):6409-6412 1990.

**Random Sequence**

**Complex Repeats**

# Spacing

- Position weight array created
- $1 - \cos((2 * \pi / \text{featureDomain}) * (k + 25))$

# Blat

- Order sequences according to  $T_m$ , position, self-binding properties
- Similar to blast
  - ~150-fold faster
  - Different mismatch handling from Blast
- Permit
  - Single blat match
  - Blat match with double the identity of the remaining matches

# Speed

- ~2 Mbp/hour for indiscriminant analysis
  - Longer for excluded domains
  - Shorter for included domains
  - Processor speed limited
- ~1 Mbp/hour for feature selective analysis
  - Speed a function of region length
  - Processor speed limited

# Results and Limitations

- Chromosome III at minimal domain size of 200:
  - Even, indiscriminant tiling:
    - 85% of 68,916 potential domains had acceptable features
    - Yield of 58,722 features
  - Selective feature tiling:
    - 85% of 73,392 potential domains had acceptable features
    - Yield of 62,347 features
    - Breakdown:
      - Interexonic: 40,470
      - Exons: 18,749
      - Small introns: 3125

# Results and Limitations

- Genome scan at minimal domain size of 200:
  - Even, indiscriminant tiling:
    - 86.7% of potential domains had acceptable features
    - Yield of 434,608 features
- Genome scan at minimal domain size of 150:
  - Even, indiscriminant tiling:
    - ??% of potential domains had acceptable features
    - Yield of ~555,700 features

# Final spacing

Final spacing of ~160 base pairs for a feature domain

532,183 features

Chrom.	Total	Included	%
I	94202	77903	82.70
II	95495	81336	85.17
III	86145	71642	83.16
IV	109336	92530	84.62
V	130763	109380	83.64
X	110742	99392	89.75
total	626683	532183	84.92

# Final Tm Distribution

Chrom	% in +/- 5°C	% in +/- 3°C
I	97.67	89.18
II	97.87	90.45
III	97.78	89.40
IV	98.12	89.69
V	98.37	91.82
X	98.68	92.15
Total	98.13	90.59

# Result visualization

## lin-39 and hox cluster

# ceh-13 and hox cluster

# Gene depleted region

# Gene rich region

# Zoomed in portion of gene-rich
